This course introduces you to the concept of equilibrium. In chemistry, equilibrium is not what it appears to be at the macroscopic level. You will find that chemical equilibria involve molecules changing back and forth between products and reactants. You will find that up to now, chemical systems have been treated simplistically as reactants forming

EQUILIBRIUM SUMMARY. Equilibrium has been reached when concentrations no longer change over time. The equilibrium constant of a reaction in the reverse direction is the inverse of the equilibrium constant of the reaction in the forward direction. The equilibrium constant of a reaction that has been multiplied by a number is the equilibrium constant of the reaction raised to a power equal to that number.
