(PDF) Feedback Control Of Dynamic Systems

A hybrid control system is a feedback system whose variables may flow and, at times, jump. Such a hybrid behavior can be present in one or more of the subsystems of the feedback system: in the system to control, i.e., the plant; in the algorithm used for control, i.e., the controller; or in the subsystems needed to interconnect the plant and the controller, i.e., the interfaces/signal ...

Feedback Control of Hybrid Dynamical Systems | SpringerLink

This short entry focuses on recent advances in the design of feedback control algorithms for hybrid dynamical systems. The focus is on hybrid feedback controllers that are systematically designed employing Lyapunov-based methods.

The purpose of this module is to provide an overview of fundamental feedback control system analysis and design concepts. Students will be exposed to block diagram analysis, analysis using Laplace transforms, modeling of dynamical systems, linearization, transient analysis, sinusoidal steady state analysis, stability, design specifications, internal model principle, root locus and Bode plot analysis, polar plots, stability margins, and computer aided design.

EEE-480/591: Feedback Control Systems

Recap and Today's Topics □ In the last lecture, we discussed the concept of an equilibrium point and used phase portraits to visualise 2D system behaviour. □ The goal of control is to make the desired state value an asymptotically stable equilibrium point of the controlled system such that today's topics are: □ Definition of stability □ Stability of linear dynamical systems
