Welcome to the EUMETSAT course on monitoring the oceans from space. The oceans, this vast expanse of blue, are the biggest feature on our planet. They're the reason that we call Earth "the blue planet." They're an important part of the Earth's engine.

Ocean current velocity can thus be computed from the slope of the ocean surface. Furthermore, as water heats up, it expands, and as it cools, it contracts, affecting the height of sea surface as well. Measuring the ocean surface topography thus gives the required information for studying global ocean circulation and the oceans heat budget.

Scientists can use this measurement to
calculate the distance between the satellite
and the ocean surface in that particular
location. Jason-3 orbits about 800 miles
(1,300 kilometers) above Earth. Even from
that far away, Jason-3 can measure the
distance from itself to the ocean surface to
within about one inch (about three
centimeters).
