## STEAM TABLES - Chemical Engineering Faculty

In steam tables the properties of the dry steam are listed and for the wet steam the properties may be calculated from the steam tables of the dry and saturated steam. For values that are not listed exactly in the tables, the value between two figures can be obtained by linear interpolation. Interpolation is a mathematical tool by which, depending on the interval between two variables, a value in between can be calculated. The steam table shown above is a saturated water and steam table.

STEAM TABLES. The following tables of the properties of steam are taken directly from Chapter 5.5.3 of the Heat Exchanger Design Handbook, 1986, by C. F. Beaton. The tables in this section are reprinted, with permission, from NBS/NRC Steam Tables. The reference state for all property values is the liquid at the triple point, for which state the specific internal energy and the specific entropy have been set to zero.

On the basis of unit mass, steam can hold a significant amount of energy. It ranges from 1000 to 1250 BTU/lb which can be converted into mechanical operations as heat or using a turbine. Moreover, most of the heat content in steam is latent heat, therefore; it can be transported at the same temperature as well.
