Story Manhattan - Hospital for Special Surgery HSS Manhattan, NY *Total Hip Replacement Kaiser Permanente*

Total hip replacement is a step-by-step surgery to replace the hip socket and the ball at the top of the thighbone (femur). Doctors use metal, ceramic, or plastic replacement parts. The parts may be attached to the bones in one of two ways. They may be:

Cemented to the bone.

Uncemented. These parts have a porous coating that the bone grows into.

*Total Hip Replacement Surgery | Kaiser Permanente*

Covers surgery to replace ends of both bones in a damaged joint to create new joint surfaces.

Hip replacement surgery uses metal, ceramic, or plastic parts to replace the ball at the top of the thighbone (femur). In a total hip replacement, the doctor also replaces the hip socket. In a partial hip replacement, the socket is not replaced. For traditional surgery, your doctor will make a 6- to 10-inch cut (incision) on the side or the back of your hip.

bone cement, but because uncemented implants have been so successful, there is no longer controversy about the use. Most hip sockets are replaced with uncemented implants, since these have been shown to be more durable and to be easier to revise than cemented sockets.

### *Controversies in Hip Replacement - Kaiser Permanente*

Anterior hip replacement surgery is done through a small incision in the front (anterior) of the hip. This causes less damage to muscles and other soft tissues than the more common type of surgery. There is also a lower risk of the new ball on the thighbone slipping out of the hip socket
